

# The l3str-format package: formatting strings of characters

The L<sup>A</sup>T<sub>E</sub>X Project\*

Released 2023-05-11

## 1 Format specifications

In this module, we introduce the notion of a string  $\langle\text{format}\rangle$ . The syntax follows that of Python's `format` built-in function. A  $\langle\text{format specification}\rangle$  is a string of the form

$\langle\text{format specification}\rangle = [[\langle\text{fill}\rangle]\langle\text{alignment}\rangle][\langle\text{sign}\rangle][\langle\text{width}\rangle][.\langle\text{precision}\rangle][\langle\text{style}\rangle]$

where each [...] denotes an independent optional part.

- $\langle\text{fill}\rangle$  can be any character: it is assumed to be present whenever the second character of the  $\langle\text{format specification}\rangle$  is a valid  $\langle\text{alignment}\rangle$  character.
- $\langle\text{alignment}\rangle$  can be < (left alignment), > (right alignment), ^ (centering), or = (for numeric types only).
- $\langle\text{sign}\rangle$  is allowed for numeric types; it can be + (show a sign for positive and negative numbers), - (only put a sign for negative numbers), or a space (show a space or a -).
- $\langle\text{width}\rangle$  is the minimum number of characters of the result: if the result is naturally shorter than this  $\langle\text{width}\rangle$ , then it is padded with copies of the character  $\langle\text{fill}\rangle$ , with a position depending on the choice of  $\langle\text{alignment}\rangle$ . If the result is naturally longer, it is not truncated.
- $\langle\text{precision}\rangle$ , whose presence is indicated by a period, can have different meanings depending on the type.
- $\langle\text{style}\rangle$  is one character, which controls how the given data should be formatted. The list of allowed  $\langle\text{styles}\rangle$  depends on the type.

The choice of  $\langle\text{alignment}\rangle =$  is only valid for numeric types: in this case the padding is inserted between the sign and the rest of the number.

## 2 Formatting various data-types

\tl\_format:Nn \* \tl\_format:nn {*token list*} {*format specification*}

\tl\_format:cn \* Converts the *token list* to a string according to the *format specification*. The *style*, if present, must be **s**. If *precision* is given, all characters of the string representation of the *token list* beyond the first *precision* characters are discarded.

\seq\_format:Nn \* \seq\_format:Nn {*sequence*} {*format specification*}

\seq\_format:cn \* Converts each item in the *sequence* to a string according to the *format specification*, and concatenates the results.

\int\_format:nn \* \int\_format:nn {*intexpr*} {*format specification*}

Evaluates the *integer expression* and converts the result to a string according to the *format specification*. The *precision* argument is not allowed. The *style* can be **b** for binary output, **d** for decimal output (this is the default), **o** for octal output, **X** for hexadecimal output (using capital letters).

\fp\_format:nn \* \fp\_format:nn {*fpexpr*} {*format specification*}

Evaluates the *floating point expression* and converts the result to a string according to the *format specification*. The *style* can be

- **e** for scientific notation, with one digit before and *precision* digits after the decimal separator, and an integer exponent, following **e**;
- **f** for a fixed point notation, with *precision* digits after the decimal separator and no exponent;
- **g** for a general format, which uses style **f** for numbers in the range  $[10^{-4}, 10^{<precision>}]$  and style **e** otherwise.

When there is no *style* specifier nor *precision* the number is displayed without rounding. Otherwise the *precision* defaults to 6.

## 3 Possibilities, and things to do

- Provide a token list formatting *style* which keeps the last *precision* characters rather than the first *precision*.

# Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
